

# At Liscio, Security is Our Top Priority

Communication travels over a private, invite-only network. This minimizes the threat posed by phishing and other business-email-compromise attacks.

All traffic between firm and client is secured by SHA-256 with RSA Encryption. All data at rest is encrypted.

Messaging, Tasks, Files, and eSignatures reside in a single application, minimizing the number of links sent via email and number of logins needed to do business.

Logins, passwords, EINs, and SSNs are hashed at the database level.

Profile settings include strong multi-factor authentication using Google Authenticator and visibility into all devices signed in to your account.

Liscio users receive a 'New Log In' email when signing in on an unrecognized device - the email includes a timestamp, IP address, and ISP location.

Liscio stores and processes data at one of the top three cloud infrastructure providers. Third-party security reviews are regularly performed.
